Who will we lose next, and is it worth acting?

Executive churn briefing: findings, limitations, recommended action

Analysis of 4,994 synthetic SaaS customers | October 2026

Bottom line: target the riskiest 10%, but pilot before scaling

We can identify who is likely to leave. Whether outreach pays back depends on a save rate we have not yet measured.

24%
of customers churned

$69k
monthly revenue lost
(18% of $384k)

70%
churn in High-risk tier
(476 customers)

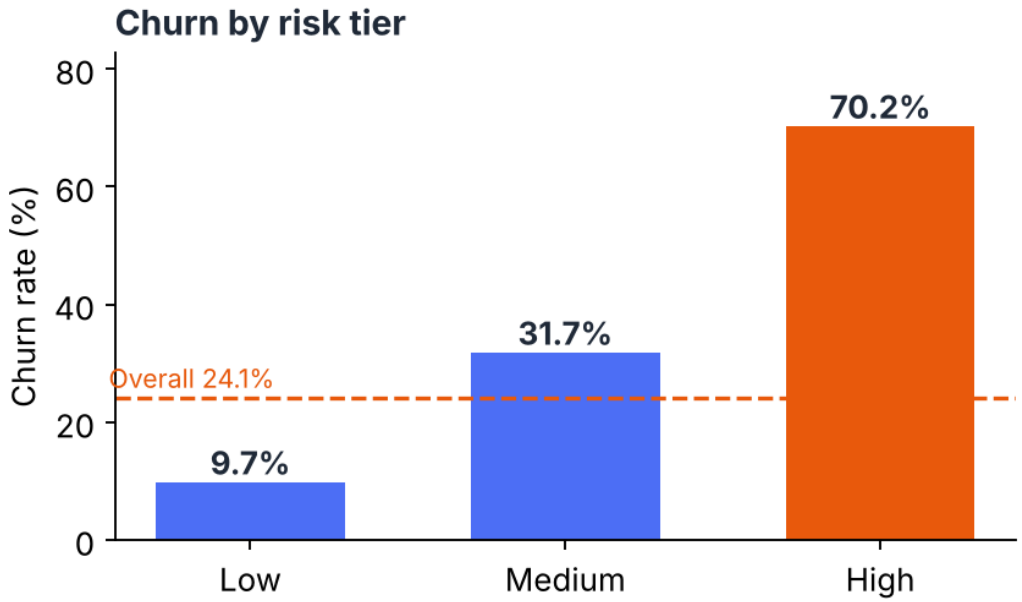

8%
save rate needed to
break even (assumed)

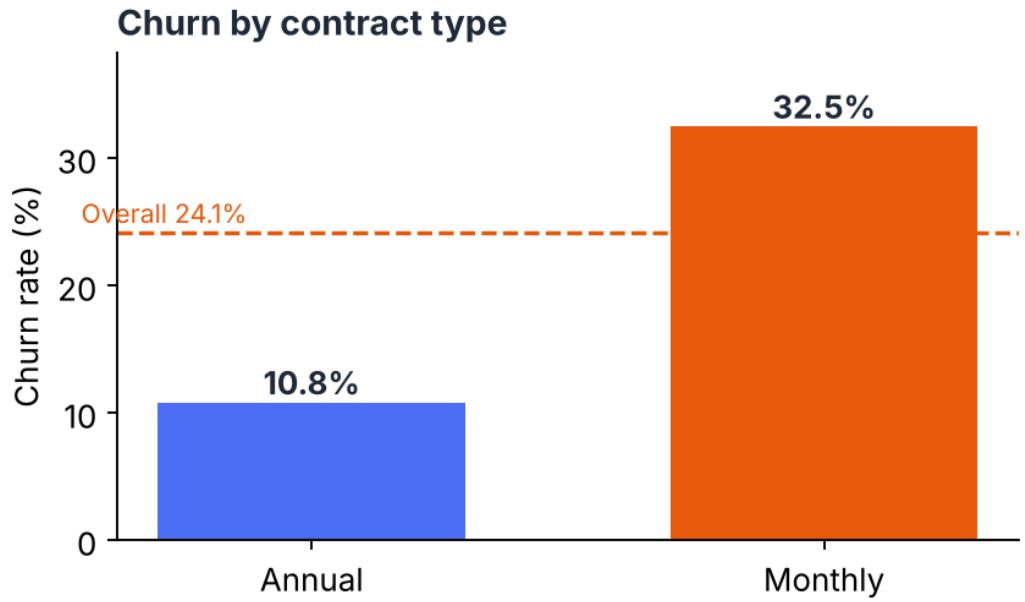

- **Recommendation:** run a 1-month outreach pilot on the 476 High-tier customers with a 50/50 holdout group.
- **Expected impact:** net year-1 result of about **-$8k to +$26k** (base case +$4k), driven mostly by how many customers outreach actually saves.
- **Decision needed:** approve the pilot and agree a go/no-go threshold (save rate above about 8%).

Synthetic data. Illustrative figures, not real customers.

Insights 1 and 2: risk is concentrated, and contract type matters

The score finds a small group that churns far above average. Monthly contracts churn at 3x the annual rate.

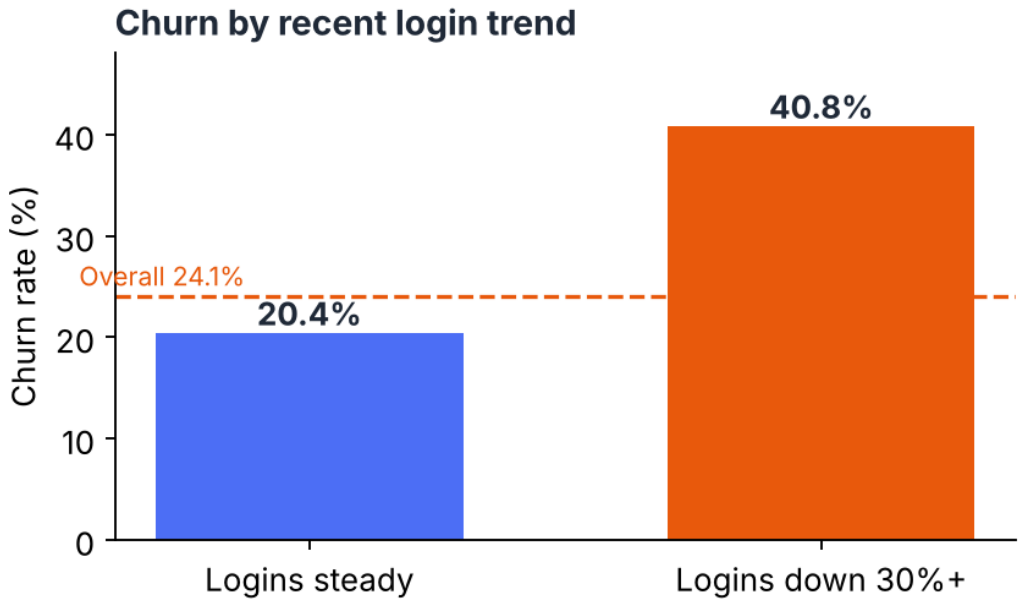

1. Concentrated risk. The High tier is 10% of customers yet churns at 70%. The top 20% by score holds 46% of all churners.

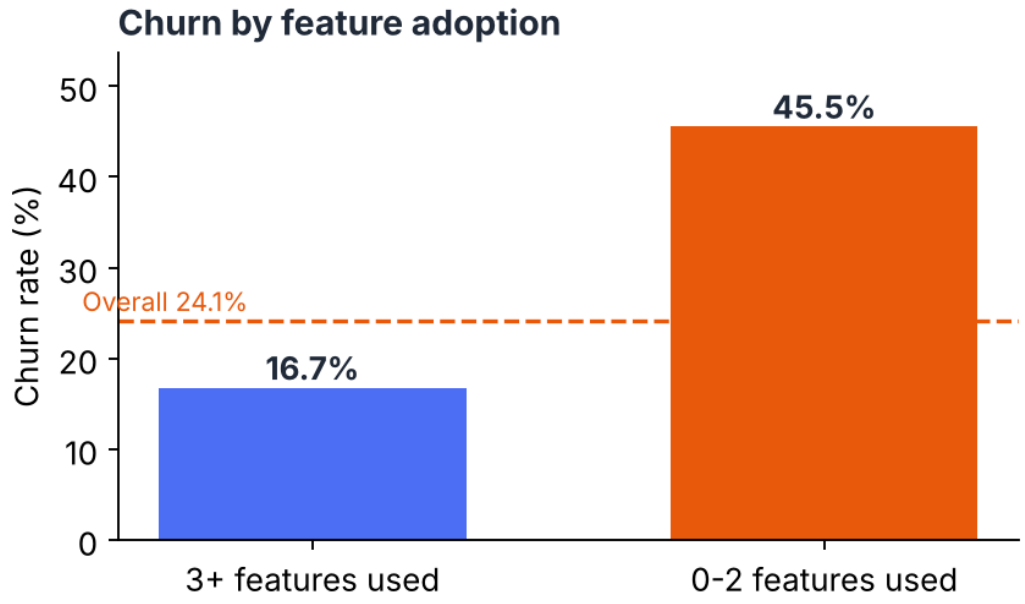

2. Contract type. 3,066 customers are on monthly plans and churn at 32%, versus 11% for annual. Moving customers to annual is the cheapest lever, but this is an association, not proof.

Synthetic data. Illustrative figures, not real customers.

Insights 3 and 4: falling usage and low adoption warn us early

Both signals are visible weeks before cancellation and can be monitored automatically.

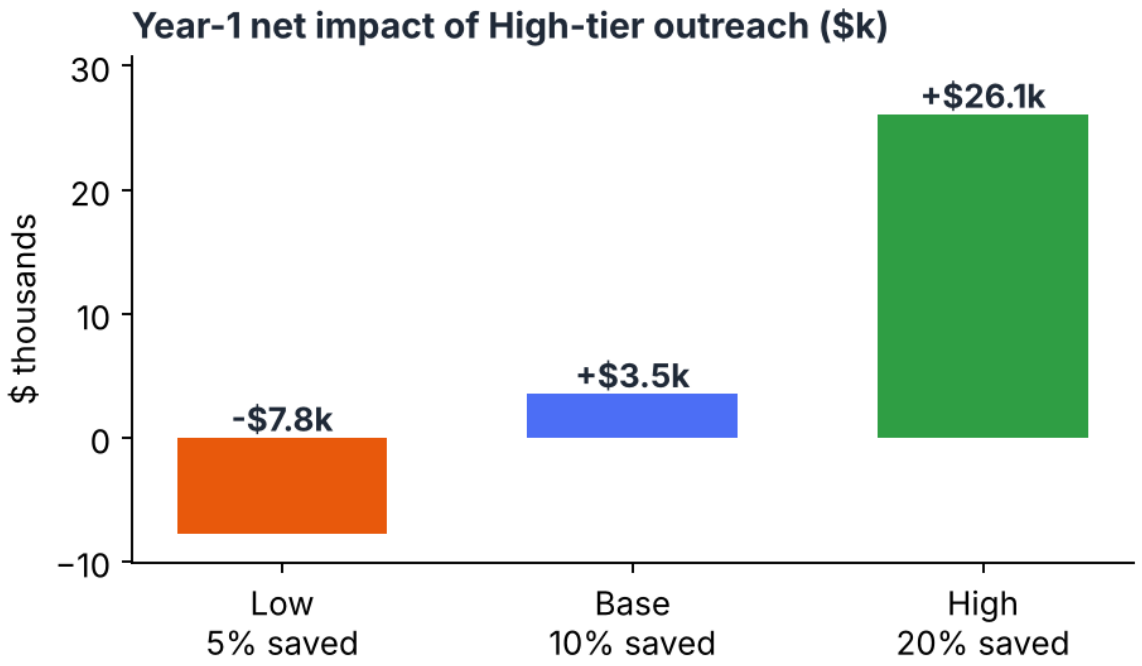

3. Usage decline. 907 customers cut logins by 30% or more and churn at 41%, double the 20% of steady users.

4. Low adoption. 1,274 customers use two or fewer features and churn at 46% versus 17%. This is the largest group we can act on through onboarding.

Synthetic data. Illustrative figures, not real customers.

Insight 5: outreach is close to break-even

At-risk customers pay about $56 a month, so each save is worth little. The outcome hinges on the save rate.

Assumption	Value
Customers contacted	476 (High tier)
Would-be churners	334 (70%)
Revenue per churner	$56 / month
Cost per contact	$40 (assumed)
Value of a save	12 more months of revenue
Save rate range	5% / 10% / 20% (assumed)
Break-even save rate	8.4%

None of the save rates above has been measured. They are planning assumptions, which is why we recommend a pilot.

Customers saved: about 17 to 67. Revenue kept per year: $11k to $45k against $19k of outreach cost.

Synthetic data. Illustrative figures, not real customers.

Recommended action: match the play to the reason customers leave

Segment	Customers	Churn	Play
Disengaging	796	40%	Outreach within 7 days of a 30%+ login drop; usage review call
Friction & Billing	574	34%	Named owner for open tickets; billing support, auto-pay
New & Unproven	609	30%	30/60-day onboarding; activate 3 core features
Stable Monthly	2,068	23%	Low-cost annual-plan offer only; no personal outreach
Committed Core	947	3%	Protect; no discounts; referrals and expansion

- **Pilot design:** one month, High tier plus Disengaging, half contacted and half held out.
- **Go if** the measured save rate is above about 8%. **Stop or redesign if** it is below.
- **Then:** recalibrate the score on real outcomes and revisit thresholds.

Synthetic data. Illustrative figures, not real customers.

Limitations: what this analysis cannot tell us

- **Synthetic data.** The method is demonstrated; the specific rates are not real-world evidence.
- **Association, not causation.** A monthly contract flags risk; it does not prove switching to annual prevents churn. Only the pilot can show that.
- **The score ranks, it does not predict.** A score of 60 is not a 60% chance of leaving.
- **Impact figures rest on assumptions** (save rate, cost per contact, 12-month value of a save). Treat the range, not the base case, as the message.
- **Judgement thresholds.** The 30% login drop and 21-day inactivity cut-offs were chosen by hand and should be reviewed on real outcomes.
- **Timing.** In production every input must be measured before the churn window, or the score will leak the answer.
